

AEMaaCS Authoring Best Practices

Authors & Content Designers – SHRSS Volume

This volume assumes the SHRSS AEM Content Authoring Guide exists as the “how-to” manual. Here we focus on **advanced tips, tricks, and real-world patterns** beyond Experience League.

1. Authoring Mental Models

- **Pages vs Content Fragments (CFs)**
 - Pages = where layout and storytelling happen.
 - CFs = the “records” for Jobs, Events, News, Locations, Shared Data.
- **Components**
 - Components are your building blocks. Many SHRSS components are based on **Core Components**, so patterns are consistent.
- **Tags & Shared Data**
 - Tags and shared CFs ensure **Jobs, Events, News, and Locations** all “speak the same language” for filters, cards, and navigation.

For basic tutorials, see:

- [Authoring a page in AEM Sites](#)
- [Content Fragments](#)

2. Jobs Authoring – Advanced Patterns

2.1 When to Create Manual Jobs vs Wait for Workday

- Use **Workday jobs** for real, externally posted roles.
- Use **manual jobs** only when:
 - A job is not yet in Workday but needs visibility (e.g., immediate event hire).
 - You need a special promotional job not tracked in Workday.

Tip: Keep manual jobs aligned with Workday’s taxonomy (departments, locations, job types) so lists and filters behave consistently.

2.2 Working with Job CFs

Key patterns from the authoring guide:

- Jobs CFs live under: Assets > Files > SHRSS > Content Fragments > Jobs > <region>/<country>/<property>
- Two types:
 1. **API-driven (Workday)**

- Fields like Job ID, title, Workday URL, location data are controlled by Workday.
- You only adjust **image, hot job flag, SEO/JSON-LD overrides**.
- “Is API Data” toggle = ON.

2. Manual

- You control all fields.
- Must maintain tags and categories manually.
- “Is API Data” toggle = OFF.

Tips & Tricks

- Do **not** change Workday IDs in Workday jobs; they are the “primary key” that syncs data.
- Use **Hot Job** sparingly; if everything is “hot”, nothing is.
- When jobs don’t appear:
 - Check CF is **published**.
 - Check **category and location tags** match the filters used on the Jobs listing component.
 - Check **post date/expiration date** fields: expired jobs are often auto-filtered.

2.3 Jobs on Pages – Components

Typical components:

1. Job Search / Listing

- Driven by CF queries (or GraphQL persisted queries).
- Filters: department, job type, location, sometimes tags.
- Authorable settings often include:
 - Default filters.
 - “No results” message.
 - Page size (# of jobs per page).

2. Job Card / Job Detail

- Reads a single Job CF (from URL or component config).
- Shows description, requirements, location, and structured data for SEO.

Advanced Tips

- If a particular property or region wants a custom jobs view:
 - Create a **section landing page** and configure the listing component to filter to that region/property via tags. Avoid creating separate job CF folders unless IA requires it.
- For SEO:

- Use the override fields only when necessary; try to keep them aligned with Workday titles so analytics remains consistent.

3. Events Authoring – Advanced Patterns

3.1 Events CFs

Events are CFs that typically include:

- Title, summary, long description.
- Start/end date & time, status (scheduled, cancelled, postponed).
- Status message (e.g., “Cancelled – weather”).
- Location reference (Location CF).
- Hero/card image.

Tips

- Use **status + status message** rather than editing the title to show “Cancelled” – this keeps URLs and analytics stable.
- For multi-day events, be consistent in how you set start/end times; filters and calendar views depend on this.

3.2 Events on Pages

Components:

- **Event List / Calendar**
 - Often filterable by date range, event type, location.
- **Event Detail**
 - Pulls all CF fields, including structured location and images.

SHRSS Overlay Tips

- “Hiring events” may reuse Events CFs but be shown in Careers context:
 - Ensure tags **bridge Jobs and Events** (e.g., same property tags).
- Past events:
 - Often left visible for SEO but clearly marked as “Past.”
 - Coordinate with the PM on whether old events should be auto-archived from lists.

4. News Authoring – Advanced Patterns

4.1 News CFs vs Pages

- CFs capture:
 - Headline, summary, publish date, author, category, hero image.
- Pages handle:

- Long-form content, layout, related content teasers.

Tips

- Use CF fields for any property that appears in **cards or lists** (e.g., category, publish date).
- Avoid “hiding” critical metadata in the page body; it won’t be queryable.

4.2 News Lists

- News list components typically allow:
 - Filter by category and date.
 - Sorting by publish date.
- For property or brand-specific news:
 - Use tag filters rather than separate pages/folders wherever possible.

5. Locations Authoring – Advanced Patterns

5.1 Location CFs Driven by DPLT

- Locations CFs are **not arbitrary**:
 - They map to DPLT location records.
 - Contain address, geo coordinates, display names, and sometimes contact info.

SHRSS Tips

- If a location is wrong, don’t fix it in AEM:
 - Raise a request to update it in **DPLT**, then let sync update AEM.
- When creating content (Jobs/Events/News) tied to a location:
 - Always use the **Location CF reference**, not copy-pasted text.

5.2 Location on Pages

- Location components:
 - Map view + list.
 - Detail views with address, hours, amenities.
- Use shared location components consistently:
 - Avoid manual, free-form address blocks spread across pages.

6. Navigation & Data Display

6.1 Understanding Shared Data

- Shared Data CFs and tags unify:
 - Jobs → property, department, job type.
 - Events → property, event type, brand.

- News → category, property, brand.

Tips

- Before inventing a new tag:
 - Check if there is an existing tag or Shared Data CF that fits.
- Avoid synonyms:
 - “Front office” vs “Front-of-house” – pick one and standardize.

6.2 Navigation Components

- Many navigation components are data-driven:
 - Mega menus, careers navigation, property pickers.
- When navigation seems wrong:
 - Check the underlying **Shared Data CFs** and **tags**, not just the menu component.

7. General Authoring Hygiene

- Use **View as Published** to review pages; WCM mode vs published mode can differ (personalization, targeting).
- Keep **page titles and URLs stable**; prefer redirects over deleting/recreating pages.
- Clean up **orphaned CFs** and assets periodically with DAM governance support.

8. Authoring SHRSS Overlay Summary

For SHRSS authors:

- Think in **CFs first** for Jobs, Events, News, and Locations.
- Use **tags and Shared Data** to make content discoverable and filterable.
- Respect integration boundaries:
 - Workday is the authority for jobs.
 - DPLT is the authority for locations.
- Use your SHRSS AEM Content Authoring Guide for step-by-step tasks, and this volume for “why” and “how to do it like an expert.”

Use alongside:

- The **Consolidated All-Roles Volume**.
- The **DAM Volume** for folder structure and metadata practices.
