

## Preparation and organization to facilitate discussions

### Important

**Critical prerequisite:** All existing tickets + gap analysis items + new requirements in Jira, optimized for review and analysis

We were talking internally and highly recommend that you guys create a new Jira project, "*SHRSS Phase 2 - Optimization and Hardening*" or the like.

For each of the activities below, follow ticket creation guidelines when creating new tickets and reviewing, pruning, and preparing existing tickets to ensure efficiency, accuracy, and thoroughness during the discussions.

### *Jira ticket creation guidelines:*

1. Use **one issue/piece of functionality per ticket** and **one ticket per issue/piece of functionality**, even if it affects multiple pages or other resources. Use **labels** or **tags** in a **standardized consistent manner** to group tickets by component, process, functional area, site, etc.
    - **Good:** Multiple tickets for distinct issues with the carousel component
    - **Bad:** One carousel component ticket with >1 issue
  2. List all author **and** publish URLs in the ticket
  3. Fill in **Environment (Dev, QA, Stage, Prod)**, **Steps**, **Actual vs Expected**, **Business Impact**, and **Workaround**.
  4. Attach at least **one screenshot or short recording**.
  5. Choose **Severity** based on impact and resolution priority (Blocker/Critical/Major/Minor/Trivial).
    - **IMPORTANT:** If all tickets are showstoppers, the categorization loses value and contributes to churn/noise
  6. Add **clear acceptance criteria** bullets in the ticket so we know exactly what to verify when we mark it as fixed.
- **Move existing tickets** that are **must have** from current project to new project
    - Candidates
      - Required for **expanded author adoption** and **ownership**
        - Hardening component dialogs
        - Reducing LOE/removing impediments for day-to-day, critical operations
        - Mitigate redundant/repetitive authoring steps
        - Required fixes/changes to, and/or completion of, **Hotels** and **Cafes** functionality
        - An exercise should be to review the current Hotels and Cafe functionality to assess where things stood before pause of these workstreams and what needs to be done for **Hotels and Cafe migration readiness**.

- Etc.

- **Create new gap item tickets**, *if* an existing ticket does not exist
- **Create new requirement/wishlist tickets**

*This is the fun part!*

- Enhancements to existing functionality/components (new capabilities, not fixes)
- New functionality/components
- New AEM feature/capability integration
